

Some parameters of a class of codes on algebraic graphs

Fernando Piñero, University of Puerto Rico – Ponce

We study a class of linear codes defined on a graphs given by algebraic relations. These graphs are generalizations of the point-line incidence graph of an affine space and they have good spectral properties, which makes them ideal for linear codes. As these graphs are defined by polynomial equations over a finite field, we use algebraic techniques to determine the dimension in certain cases.

Keywords: Ramanujan Graphs, Linear Codes, Groebner basis, generalized LDPC codes
