

New successor rules for constructing De Bruijn sequences

Joe Sawada*, University of Guelph, Canada

A de Bruijn sequence of order n is a string of length 2^n such that every binary string of length n appears exactly once as a substring when the sequence is considered cyclicly. We present a brief history regarding the efficient generation of de Bruijn sequences followed by the presentation of new and simple successor rules for constructing four different de Bruijn sequences.

Keywords: de Bruijn sequence, necklace, successor rule
